

## Highlight one or more families in the analysis

### Attentie voor Nederland & België:

Gebruik RadarOpus versie 4.1.11 en zet de **menubalk** op het **Engels**.

De familie-database moet nog vertaald worden en zal in een volgende update beschikbaar zijn ook met de Nederlandse menubalk.

Verander de menubalk-taal als volgt: Ga naar **EXTRA, Algemene instellingen**, en kies Nederlands:

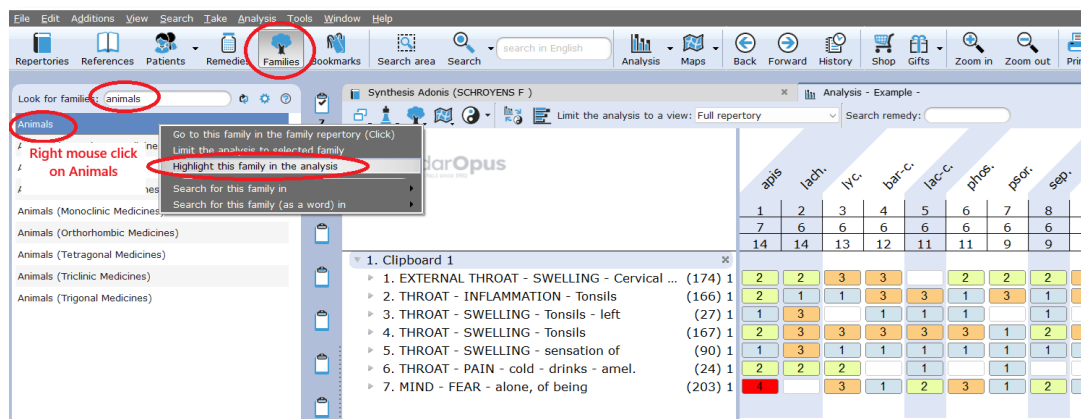

## Highlight one or more families

After taking symptoms and showing the analysis, one way to highlight certain families is with the **Table Of Content (TOC) of families**.

For example type **Animals** to select the Main group.

Right-mouse click on Animals and select Highlight this family in the analysis.

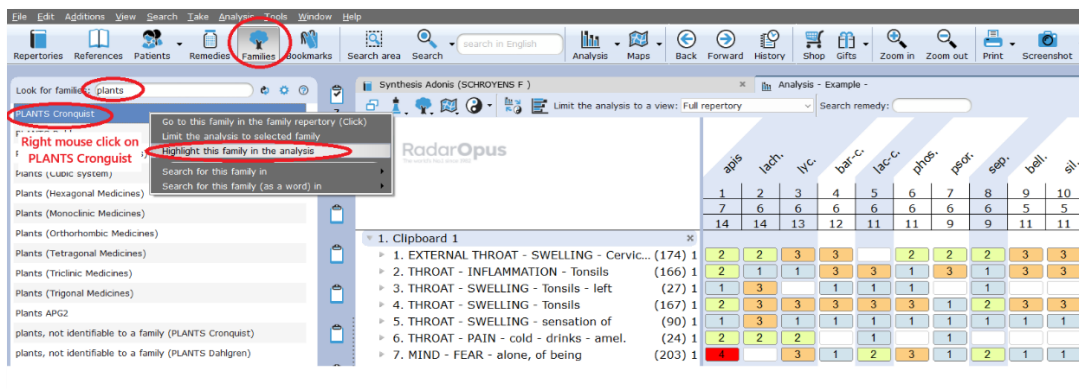

And all animal remedies are highlighted.

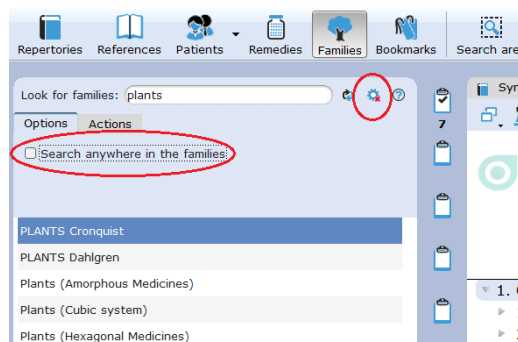

To also highlight also the Plants at the same time (so both Plants and the Animals) you can look up in the TOC of families the main group Plants .

Right-mouse click on **Plants Cronquist** (which is an older classification system, mostly used.)

You can also use **Plants APG2** (which is a modern classification system), but we select the Main level, so both will give the same result “all plants” will be included)

**Tip:** You should change the local setting and de-select “Search anywhere in the families”, to more easily find the main groups. If you then type a few characters, the name should **Begin** with those characters.

You can also highlight all other family members of a remedy in the analysis

In the analysis, right-click on a remedy. Then select Highlight all family members of this remedy.
